The esg8022pset class*

Jason Gross
jgross@mit.edu

March 13, 2011

1 Introduction

The esg8022pset class provides a template for ESG class PSets.

It is set up so that there is one master file, which contains both problems and solutions. It might look something like

```
\documentclass{esg8022pset}
\begin{preamble}
\usepackage{amsmath}
\end{preamble}

\classname{\LaTeX}
\semester{Spring 2011}
\problemsetnumber{0}
\duedate{Today}
\psettitle{\LaTeX}

\begin{document}

\begin{problem}{Example Problem}
  Learn \LaTeX.
\end{problem}
\begin{solution}
  Read \emph{The Not So Short Introduction to \LaTeXe}
\end{solution}

\end{document}
```

If this file is called `example.tex`, then typesetting this file would create two new .tex files (a problems file called `example_Problems.tex`, and a solutions file called `example_Solutions.tex`), as well as a typeset version of the problems file. To get a typeset solutions file, you will need to typeset the `example_Solutions.tex`

*This document corresponds to esg8022pset ?, dated ?.

file.[1] If you pass the option `makesolutionspdf` to this document class, and run latex with `\write18` enabled, you will also get a pdf of the solutions file.

2 Usage

I give the usage and specification of every macro defined. I give bugs when I know them (please email me if you find other bugs, or have fixes for the bugs I list). I sometimes give extra description or justification.

`\duedate` Usage: `\duedate{`⟨*date*⟩`}`
Specification: The ⟨*date*⟩ is used as the due date.

`\problemsetnumber` Usage: `\problemsetnumber{`⟨*number*⟩`}`
Specification: The ⟨*number*⟩ is used as the problem set number.

`\semester` Usage: `\semester{`⟨*semester*⟩`}`
Specification: The ⟨*semester*⟩ is used as the semester of the class.

`\classname` Usage: `\classname{`⟨*name*⟩`}`
Specification: The ⟨*name*⟩ is used as the name of the class.

`\readingassignment` Usage: `\readingassignment{`⟨*assignment*⟩`}`
Specification: The ⟨*assignment*⟩ is used as the reading assignment. If it's empty, or if this command is not called, no reading assignment is shown.

`\problemsettitle` Usage: `\problemsettitle{`⟨*title*⟩`}`
Specification: The ⟨*title*⟩ is used as the problem set title.

`problem` Usage: `\begin{problem}[`⟨*number*⟩`]{`⟨*description*⟩`}`
Specification: The ⟨*number*⟩ is used as the problem number, and defaults to the current section number (and is automatically incremented). The ⟨*description*⟩ is used as the problem title/description. This command typesets a problem, which is written both the this file, the problems tex file, and the solutions tex file.

`solution` Usage: `\begin{solution}`
Specification: Typesets the solution to a problem in the solution tex file.

`ForProblems` Usage: `\begin{ForProblems}`
Specification: Inserts code into only the problem set file.

`ForSolutions` Usage: `\begin{ForSolutions}`
Specification: Inserts code into only the solutions file.

`ForPSet` Usage: `\begin{ForPSet}`
Specification: Inserts code into both the problems and solutions file.

3 Options

```
1 \newboolean{esg8022pset@solutions}\newboolean{esg8022pset@problems}
2 \newboolean{esg8022pset@pdfproblems}\newboolean{esg8022pset@pdfsolutions}
3 \DeclareOption{problems}{\setboolean{esg8022pset@problems}{true}\setboolean{esg8022pset@solutio
4 \DeclareOption{solutions}{\setboolean{esg8022pset@problems}{false}\setboolean{esg8022pset@solut
5 \DeclareOption{makeproblemspdf}{\setboolean{esg8022pset@pdfproblems}{true}}
6 \DeclareOption{makesolutionspdf}{\setboolean{esg8022pset@pdfsolutions}{true}}
```

[1] I am still trying to figure out how to get two pdfs (or dvis, etc.) out of a single .tex file. When I figure out how to do this, typesetting the solutions file separately will not be necessary.

```
\DeclareOption{makeallpdfs}{\setboolean{esg8022pset@pdfproblems}{true}\setboolean{esg8022pset@p
\ProcessOptions\relax
\LoadClass[notitlepage,11pt,twoside,letterpaper]{article}
\RequirePackage[margin=1in]{geometry}
```

4 Setup

```
\ifthenelse{\boolean{esg8022pset@problems} \OR \boolean{esg8022pset@solutions}}{

`\duedate`
`\problemsetnumber`
`\semester`
`\classname`
`\readingassignment`
`\problemsettitle`

These four macros are provided by `esg8022pset.dtx` to provide information about the class assigning the pset. The information is stored away in internal control sequences. It is the task of the `\maketitle` command to use the information

provided. The definitions of these macros are shown here for information.

```
