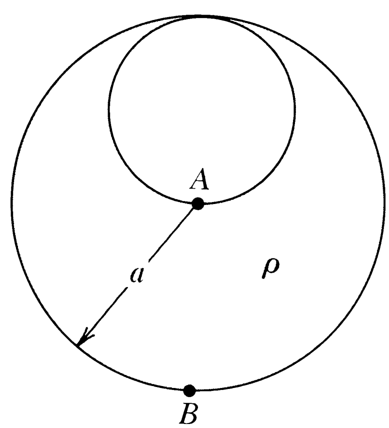
Problem Set 2

Due: Sunday, February 13

Problem 1: Purcell 1.16

The sphere of radius a was filled with positive charge at uniform density ρ. Then a smaller sphere of radius $a/2$ was carved out, as shown in the figure, and left empty. What are the direction and magnitude of the electric field at A? At B?



Problem 2: Purcell 1.17

(a) A point charge q is located at the center of a cube of edge length d. What is the value of $\int \vec{E} \cdot d\vec{a}$ over one face of the cube?

(b) The charge q is moved to one corner of the cube. What is now the value of the flux of $\vec{E}$ through each of the faces of the cube?

Problem 3: Purcell 1.31

Like the charged rubber balloon described on page 31, a charged soap bubble experiences an outward electrical force on every bit of its surface. Given the total charge Q on a bubble of radius R, what is the magnitude of the resultant force tending to pull any hemispherical half of the bubble away from the other half? (Should this force divided by $2\pi R$ exceed the surface tension of the soap film interesting behavior might be expected!)

Ans. $Q^2/8R^2$.

Problem 4: Purcell 2.1

The vector function which follows represents a possible electrostatic field:

$$E_x = 6xy \qquad E_y = 3x^2 - 3y^2 \qquad E_z = 0$$

Calculate the line integral of $\vec{E}$ from the point $(0, 0, 0)$ to the point $(x_1, y_1, 0)$ along the path which runs straight from $(0, 0, 0)$ to $(x_1, 0, 0)$ and thence to $(x_1, y_1, 0)$. Make a similar calculation for the path which runs along the other two sides of the rectangle, via the point $(0, y_1, 0)$. You ought to get the same answer if the assertion above is true. Now you have the potential function $\phi(x, y, z)$. Take the gradient of this function and see that you get back the components of the given field.

Problem 5: Purcell 2.4

Describe the electric field and the charge distribution that go with the following potential:

$$\phi = x^2 + y^2 + z^2 \qquad \text{for } x^2 + y^2 + z^2 < a^2$$

$$\phi = -a^2 + \frac{2a^3}{(x^2 + y^2 + z^2)^{1/2}} \qquad \text{for } a^2 < x^2 + y^2 + z^2$$

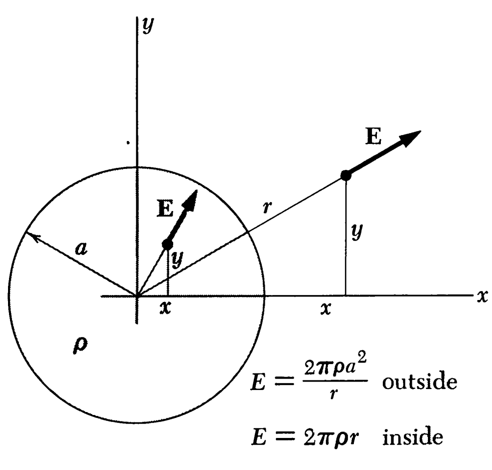
Problem 6: Purcell 2.8

For the cylinder of uniform charge density in Fig. 2.17:

(a) Show that the expression there given for the field inside the cylinder follows from Gauss's law.

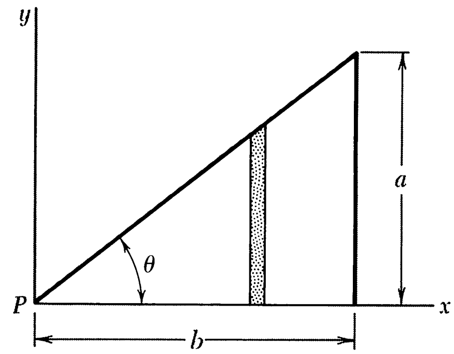
(b) Find the potential ϕ as a function of r, both inside and outside the cylinder, taking $\phi = 0$ at $r = 0$.

FIGURE 2.17
The field inside and outside a uniform cylindrical distribution of charge.



Problem 7: Purcell 2.12

The right triangle with vertex P at the origin, base b, and altitude a has a uniform density of surface charge σ. Determine the potential at the vertex P. First find the contribution of the vertical strip of width dx at x. Show that the potential at P can be written as $\phi_P = \sigma b \ln[(1 + \sin\theta)/\cos\theta]$.



Problem 8: Purcell 2.30

Consider a charge distribution which has the constant density ρ everywhere inside a cube of edge b and is zero everywhere outside that cube. Letting the electric potential ϕ be zero at infinite distance from the cube of charge, denote by ϕ_0 the potential at the center of the cube and ϕ_1 the potential at a corner of the cube. Determine the ratio ϕ_0/ϕ_1. The answer can be found with very little calculation by combining a dimensional argument with superposition. (Think about the potential at the center of a cube with the same charge density and with twice the edge length.)
